Introduction to Programming

println Statement, Primitive Data Types, Expressions, Variables

Basic Java programs with *println* statements

A Java program

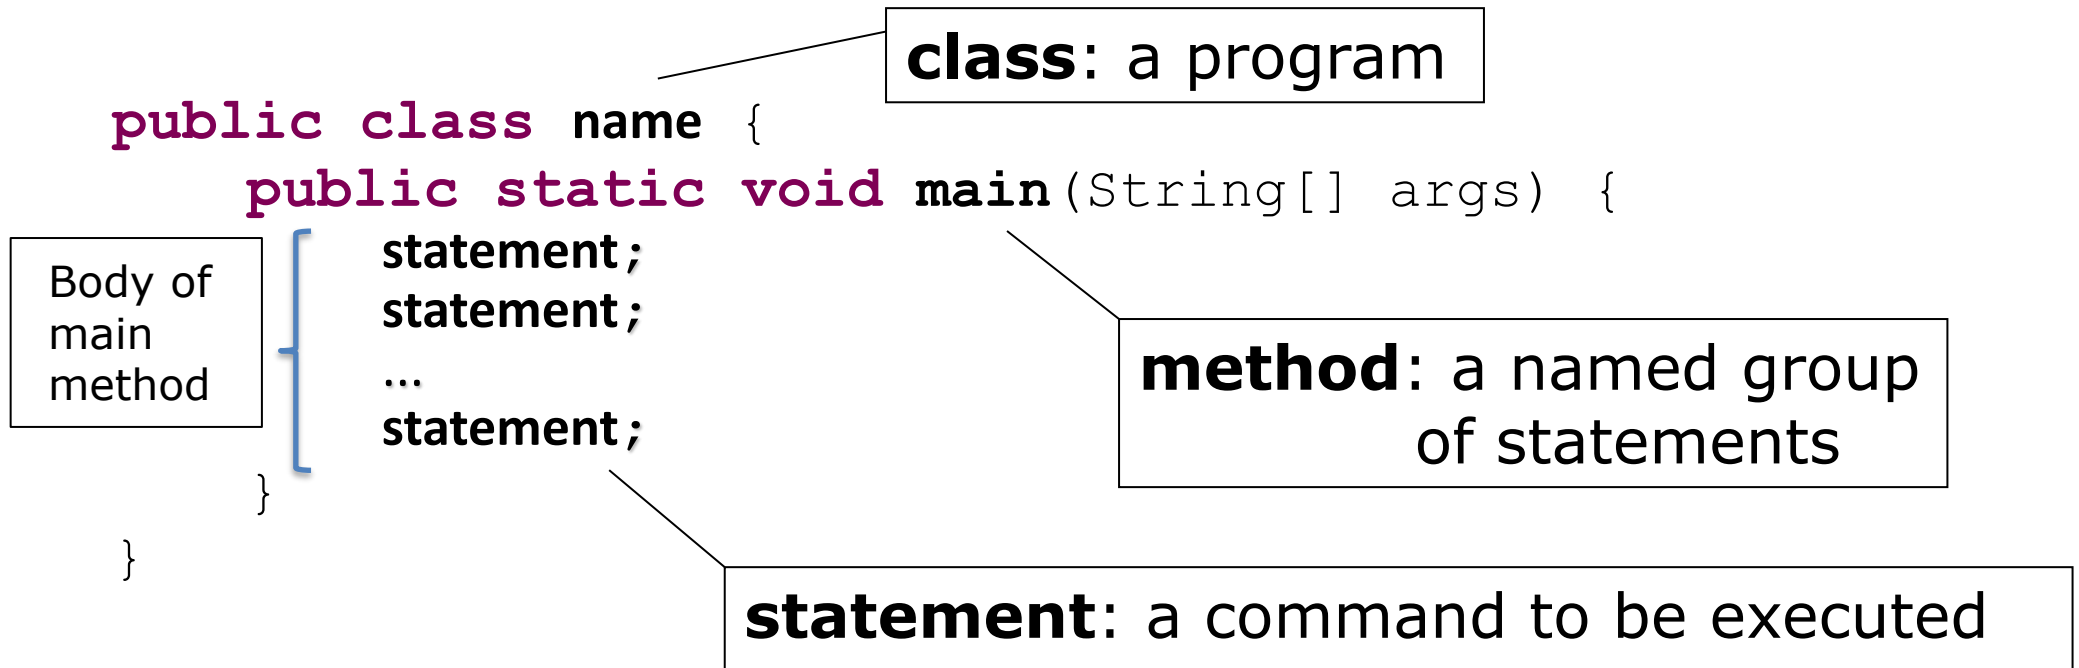

```
public class Hello {  
    public static void main(String[] args) {  
        System.out.println("Hello, World!");  
    }  
}
```

- **Its output:**

Hello, world!

- **Console window:** Text box into which the program's output is printed.

Structure of a Java program

- Every executable Java program consists of a **class**,
 - that contains a **method** named `main`,
 - that contains the **statements** (commands) to be executed.

Compile/run a program

1. Write it.

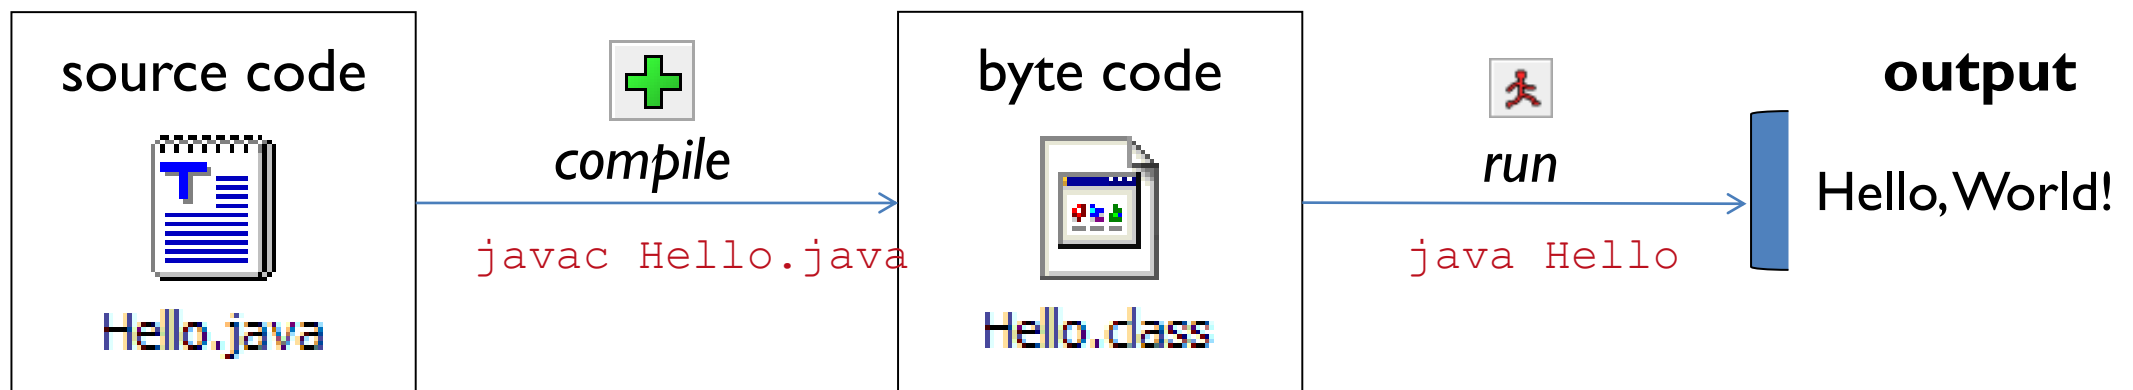

- **code** or **source code**: The set of instructions in a program.

2. Compile it.

- **javac**: translates the program from Java to bytecode
- **bytecode**: runs on many computer types (any computer with JVM)

3. Run (execute) it.

- **output**: whatever the **programmer** instructs the program to do

System.out.println

- A **statement** that prints a line of output on the console.
 - pronounced "print-linn"
 - sometimes called a "println statement" for short
- Two ways to use `System.out.println`:
 - `System.out.println("text");`
Prints the given message as output.
 - `System.out.println();`
Prints a blank line of output.

Another Java program

```
public class Hello {  
    public static void main(String[] args) {  
        System.out.println("Hello, world!");  
        System.out.println();  
        System.out.println("This program produces");  
        System.out.println("four lines of output");  
    }  
}
```

- **Its output:**

Hello, world!

This program produces
four lines of output

Names and identifiers

- You must give your program a name.

```
public class MyClass {
```

- Naming convention: capitalize each word (e.g. MyClass)
- Your program's file must match exactly (MyClass.java)
 - includes capitalization (**Java is "case-sensitive"**)

- **identifier**: A name given to an item in your program.

- must start with a letter or `_` or `$`
- subsequent characters can be any of those or a number

- **legal**: `_myName` `TheCure` `ANSWER_IS_42` `$bling$`
- **illegal**: `me+u` `49ers` `side-swipe` `Ph.D's`

Keywords

- **keyword:** An identifier that you cannot use because it already has a reserved meaning in Java.

abstract	default	if	private	this
boolean	do	implements	protected	throw
break	double	import	public	throws
byte	else	instanceof	return	transient
case	extends	int	short	try
catch	final	interface	static	void
char	finally	long	strictfp	volatile
class	float	native	super	while
const	for	new	switch	
continue	goto	package	synchronized	

Syntax

- **Syntax:** The *set of legal structures and commands* that can be used in a particular language.
 - Every basic Java statement ends with a semicolon ;
 - The contents of a class or method occur between { and }
- **Syntax error (compiler error):** A problem in the structure of a program that *causes the compiler to fail*.
 - Missing semicolon
 - Too many or too few { } braces
 - Illegal identifier for class name
 - Class and file names do not match
 - ...

Syntax error example

```
1 public class Hello {  
2     poopublic static void main(String[] args) {  
3         System.owt.println("Hello, world!")_  
4     }  
5 }
```

- Compiler output:

```
Hello.java:2: <identifier> expected  
    poopublic static void main(String[] args) {  
      ^  
Hello.java:3: ';' expected  
    }  
    ^  
2 errors
```

- The compiler shows the **line number** where it found the error.
- The error messages can be **tough** to understand!

Other types of Errors

- **Logic errors:** occur when you write code that doesn't perform the task it is intended to perform

- **Runtime errors:** are logic errors that are so severe that Java stops your program from executing.

Strings

- **string:** A sequence of characters to be printed.
 - Starts and ends with a " quote " character.
 - The quotes do not appear in the output.
 - Examples:
`"hello"`
`"This is a string. It's very long!"`
- Restrictions:
 - May not span multiple lines.
`"This is not
a legal String."`
 - May not contain a " character.
`"This is not a "legal" String either."`

Escape sequences

- **escape sequence:** A special sequence of characters used to represent certain special characters in a string.

<code>\t</code>	tab character
<code>\n</code>	new line character
<code>\"</code>	quotation mark character
<code>\\</code>	backslash character

– **Example:**

```
System.out.println("\\hello\nhow\tare \"you\"?\\\\\");
```

– **Output:**

```
\hello
how      are "you"?\\
```

Question

- What is the output of the following `println` statements?

```
System.out.println("\ta\tb\tc");
System.out.println("\\\\");
System.out.println("'");
System.out.println("\"\"\"");
System.out.println("C:\nin\tthe downward
    spiral");
```

- Output of each `println` statement:

	a	b	c
\\			
'			
"""			
C:			
in	he	downward	spiral

Question

- Write a `println` statement to produce this output:

- `println` statement to produce the line of output:

```
System.out.println("/  \  //  \\\  ///  
  \\\  \\\  ");
```

Question

- What `println` statements will generate this output?

This program prints a
quote from the Gettysburg Address.

"Four score and seven years ago,
our 'fore fathers' brought forth on
this continent a new nation."

- `println` statements to generate the output:

```
System.out.println("This program prints a");  
System.out.println("quote from the Gettysburg Address.");  
System.out.println();  
System.out.println("\"Four score and seven years ago,\"");  
System.out.println("our 'fore fathers' brought forth on");  
System.out.println("this continent a new nation.\"");
```

Question

- What `println` statements will generate this output?

```
A "quoted" String is  
'much' better if you learn  
the rules of "escape sequences."
```

```
Also, "" represents an empty String.  
Don't forget: use \" instead of " !  
' is not the same as "
```

- `println` statements to generate the output:

```
System.out.println("A \"quoted\" String is");  
System.out.println("'much' better if you learn");  
System.out.println("the rules of \"escape sequences.\"");  
System.out.println();  
System.out.println("Also, \"\" represents an empty String.");  
System.out.println("Don't forget: use \"\" instead of \" !");  
System.out.println("' is not the same as \"");
```

Comments

- **comment:** A note written in source code by the programmer to describe or clarify the code.
 - Comments are not executed when your program runs.
- Syntax:
 - // comment text, on one line
 - or,
 - /* comment text; may span multiple lines */
- Examples:
 - // This is a one-line comment.
 - /* This is a very long
multi-line comment. */

Using comments

- Where to place comments:
 - at the **top of each file** (a "comment header")
 - at the **start of every method** (seen later)
 - to **explain complex pieces** of code
- Comments are useful for:
 - Understanding larger, more complex programs.
 - Multiple programmers working together, who must understand each other's code.

Comments example

```
/* Aly Student, CMPS 241, Fall 2019
   This program prints lyrics about ... something. */

public class BaWitDaBa {
    public static void main(String[] args) {
        // Your first comment
        System.out.println("Bawitdaba");
        System.out.println("da bang a dang diggy diggy");
        System.out.println();

        // Your second comment
        System.out.println("diggy said the boogy");
        System.out.println("said up jump the boogy");
    }
}
```
